## AI-Powered Eye Disease Screening Report

|               |                                            |       |             |
|---------------|--------------------------------------------|-------|-------------|
| Report ID:    | RPT-20260530_221231                        | Date: | 30 May 2026 |
| Patient Name: | N/A                                        | Time: | 22:12:31    |
| Patient ID:   | PT-221221                                  | Age:  | N/A         |
| Generated By: | AI-Based Eye Disease Detection System v1.0 |       |             |

### ■ DIAGNOSIS RESULT

|                    |                                                                                              |
|--------------------|----------------------------------------------------------------------------------------------|
| Detected Condition | Cataract                                                                                     |
| Confidence Score   | 47.04%                                                                                       |
| Severity Level     | Moderate                                                                                     |
| Description        | Clouding of the eye's natural lens detected.                                                 |
| Recommendation     | Consult an ophthalmologist for cataract evaluation. Surgical correction is highly effective. |

### ■ CONFIDENCE BREAKDOWN (All Classes)

| Disease Class        | Confidence (%) | Status     |
|----------------------|----------------|------------|
| Cataract             | 47.04%         | ✓ DETECTED |
| Normal               | 21.60%         | —          |
| Diabetic Retinopathy | 19.03%         | —          |
| Glaucoma             | 12.32%         | —          |

### ■ EXPLAINABLE AI — GRAD-CAM ANALYSIS

The Gradient-weighted Class Activation Map (Grad-CAM) highlights the regions of the retinal image that most influenced the AI model's prediction. Warmer colors (red/yellow) indicate higher diagnostic significance.
